#### **IMPORTANT INFORMATION CONCERNING THE DIAGNOSTIC**

- 1- The device makes a complete diagnostic (mains, load and itself) as soon as the mains voltage is sufficient
- 2- The device checks only the presence of phases when the analog input voltage is above the minimum control threshold, during the ramps (softstart and softstop) and when it is full on (the power elements are tested only when analog control voltage is below the minimum control voltage threshold).
- 3- The control overrides the diagnostic.
  - If a problem occurs during the control period, the device will try to go on driving the load according the analog input voltage. If the problem goes on, it will be if possible indicated to the user according the diagnostic table.
  - If a problem occurs during the softstopping period, the device will stop immediately in order to reach the off state diagnostic period.
